DETAILED ACTION

Terminal Disclaimer

1. The terminal disclaimer filed on 8/18/06 disclaiming the terminal portion of any patent granted on this application which would extend beyond the expiration date of U.S. Patent No. 6,697,043 has been reviewed and is accepted. The terminal disclaimer has been recorded.

Allowable Subject Matter

2. Claims 67-109 are allowed.

The following is an examiner's statement of reasons for allowance: Claims 67-109 are allowed since certain key features of the claimed invention are not taught or fairly suggested by prior art. **In claim 67**, “a flexure having a plurality of flexible joints, the flexure being coupled to the actuator and the housing, the flexure being configured to translate the rotary force to a linear motion of the flexure, the flexure operative to output haptic feedback based on the rotary force”. **In claim 89**, “a mechanism including a flexure having at least a first flex joint and a second flex joint, the mechanism configured to couple the actuator portion of the actuator assembly to the housing such that movement of the actuator portion operates to provide haptic feedback to the housing in the form of an inertial force that is transferred to the housing by way of the stationary portion of the actuator assembly”. **In claim 100**, “imparting haptic feedback to a housing of the interface device by way of an actuator assembly having a stationary portion that is rigidly mounted to the housing and a movable actuator portion that is movable with respect to the housing in response to the sensor signal, the movable actuator portion being coupled to the

Art Unit: 2629

housing by way of a flexure having at least one flex joint". In claim 105, "an actuator having an actuator mass, an actuator housing and a rotating shaft; and a flexure mechanism coupling the actuator housing to the interface device by way of at least one flex joint enabling relative motion between the actuator and the interface device in response to rotation of the rotating shaft caused by said control signal, said relative motion imparting an inertial force to the interface device to thereby provide said haptic feedback". The closest prior art Rosenberg (6,211,861 B1) teaches a tactile mouse includes a sensor device able to detect the movement of the mouse in the planar workspace and an actuator is coupled to the housing of the mouse and applies an inertial force in a particular degree of freedom, however, singularly or in combination with other prior art, fail to anticipate or render the above underlined limitations obvious.

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
